

BASIC FUEL POLISHING SYSTEM SUGGESTED LAYOUT

Fuel polishing helps to reduce the impact of you experiencing problems with the Diesel bug. This Micro-organism could become a big problem if you do not control what you have in your fuel tank. Bio-diesel can be an ideal breeding ground for the bug to get established if you have any traces of water in your fuel. Fuel polishing removes water and dirt particles from the fuel tank and plus the circulation process means the fuel is being moved around the tank. The Bug loves a static environment so it can multiply.

The running time will depend on the tank size. We suggest you run the system for a couple of hours while the engine is running or you run it up every 2 – 3 weeks. The ideal set up would be to take the fuel from one side of the tank and return it to the other side of the tank. Making sure you do not impede the main engine or generator feed and return fuel lines.

Flow 121 LPH

12 and 24 volt versions

Bigger systems are available, details on request.
